

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

The authors say "We think no one can read the notes without marveling, as we have done, at one thing — how birds can withstand such a winter climate, where 85 degrees below zero Fahr. is not unusual. And yet there is at the Kolyma a quite varied winter bird fauna." The list contains 109 species or subspecies of which the following are described as new: *Lagopus lagopus koreni* (p. 4) Kolyma; *Squatarola squatarola cynosuræ* (p. 23), Baillie Island, Arctic America, proposed for the American Black-bellied Plover as distinct from that of Europe; *Circus cyaneus cernuus*, (p. 32), Kolyma; *Budytes flavus plexus* (p. 41), Kolyma; *Otocoris alpestris euroa* (p. 43), Kolyma.

The authors protest against being compelled by "existing Laws" of nomenclature to adopt *Xenus* as distinct from *Xenos*. The A. O. U. Code explicitly rules that such words are identical and the statement to the contrary in the International Code is merely a suggestion and not a part of the Code, so that they would seem to be perfectly free to follow their preference in this matter and still have the 'Laws' on their side.

Students of North American birds will be interested to learn from this paper that the Gray-cheeked Thrush is not a mere straggler in Siberia but breeds regularly as far west at least as the Kolyma River.

Altogether Messrs. Thayer and Bangs have presented an exceedingly interesting paper as well as a valuable contribution to the ornithology of a little known region.— W. S.

Stresemann on the Birds of Ceram.¹— This paper consists of a list of 153 species with full synonymy and extended annotations, covering not only the results of the author's explorations but those of all other ornithologists who had previously visited the island and whose expeditions are treated historically in the preface. The work is characterized by the same careful preparation and accuracy of detail that mark Mr. Stresemann's other publications and forms a valuable monograph of the avifauna of this interesting island. We note the following new forms: *Megapodius duperreyi buruensis* (p. 41), Buru; *Sterna bergii thalassina* (p. 57), Rodriguez; *S. sumatrana mathewsi* (p. 60), Aldabra; *Hemiprocne mystacea confirmata* (p. 110), Ceram; *Dendrobiastes hyperythra negroides* (p. 125), Central Ceram; *Myiagra galeata seranensis*, (p. 127), Central Ceram; *Pachycephala pectoralis alfurorum* (p. 132), Ceram; *Androphilus disturbans musculus* (p. 136), Central Ceram; *Zosterops obstinatus seranensis* (p. 139), Central Ceram; *Z. o. ternatanus* (p. 139), Ternate; *Erythrura trichroa pinaie* (p. 147), Central Ceram; *Dicrurus hottentottus manumeten* (p. 148), Ceram. The plates represent scenery, bills of the Hornbill, *Rhyticeros plicatus*, and colored figures of *Oreosterops pinaie*, *Stigmatops monticola* and the new *Androphilus*.— W. S.
